

BiTraDER

Test Plan

Document ID PDL026

Author: Richard Noakes

Version: 0.2

Date: 24 November 2024

1. Document Control

1.1 Change History

Version	Status	Date	Author(s)	Description of Change
0.1	Draft	14/08/2024	Richard Noakes	Initial Draft
0.2	Final	24/11/2024	Richard Noakes	Added test results and screen shots

1.2 Reviewers

The people that will be active in the evolution of this document (authoring, reviewing, approving, verifying) are listed in the table below along with an auditable record of these document management activities. In addition, their RASCI Assignment (Responsible, Accountable, Supportive, Consulted and Informed) is listed;

Name	Role	Activity	RASCI
Chris Greenfield	Project Manager	Review/Approve	Accountable
Richard Noakes	BiTraDER Solution Architect	Author	Responsible
Kundan Karadia	BiTraDER software engineer	Review	Consult
Emilis Srage	Electron	Review	Consult
Phil Woolger	Cantium Technical Architect	Review	Consult

2. BiTraDER solution overview

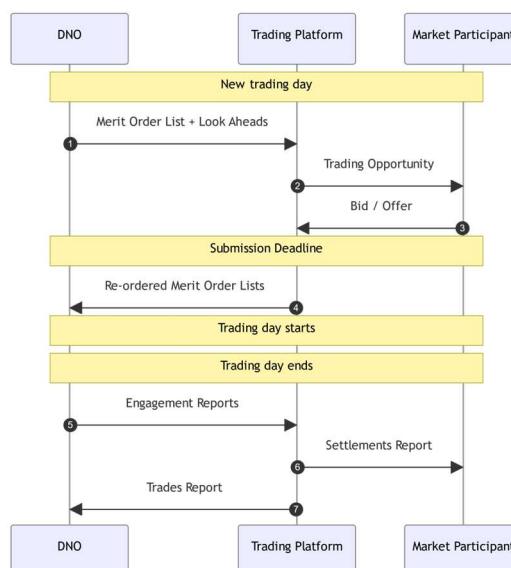

2.1 BiTraDER project overview

The BiTraDER Innovation Project is building and trialling a brand new and highly innovative flexibility market allowing Distributed Energy Resources (DERs) connected to the distribution network to trade their curtailment obligations bilaterally.

To ensure that Electricity North West Limited (ENWL) are facilitating and enabling the market, but not directly participating, the trading platform is completely independent of the Distribution Network Operator (DNO). A third-party provider, Electron, will be hosting the trading platform and presenting information provided from ENWL's Active Network Management (ANM) system as and when constraints are forecast.

1. The ANM system has 'Look ahead' functionality to forecast potential constraints. Based on network topology and outage plans, the ANM system creates a list of connected DERs such as flexible service providers along with flexible connection customers that will be curtailed or called on, to resolve each constraint. The ANM system also contains the merit order list (MOL) of all curtailable assets within the ENWL network. Both the look ahead and MOL are transferred to the Electron trading platform from the ANM system.
2. The Electron trading platform presents customers with the look ahead and MOL during a window within the day ahead period and facilitates trading based on agreed trading rules. Trading is completed and the re-traded MOL is transferred back into the ANM system, in time for each trade period the next day.
3. The ANM system receives the re-traded MOL and should a constraint occur, dispatches instructions based on the revised order. This will be via SCADA where applicable, or, in future, by other means (e.g. an Application Programming Interface (API) or similar) for all other participating customers.

A summary of the information flows is provided in the diagram below.

2.2 BiTraDER Project Test Phasing

The project has two distinct test phases as follows:

Project Test Phase 1 – Simulation trials starting in October 24:

Where customers will access the Electron trading platform to trade simulated constraints using fabricated assets. This will require a fully functional trading platform, but the customer's physical assets and the electrical network will be simulated.

The simulation trials will run ten scenarios. The trade window for each scenario will open for 2 hours at the day ahead stage with the actual trade period occurring the next day. After the trade has taken place, a Teams meeting will be held to discuss the outcomes. This will start in October 24 and complete eight months later. Each scenario will generate 10 to 20 messages.

Project Test Phase 2 – Live trials in 2025:

Where live customer assets and the live electrical network will be active, but the look ahead curtailment events will be generated through ANM manipulation. This is currently out of scope for this stage of the project.

3. Simulation Trials Test approach

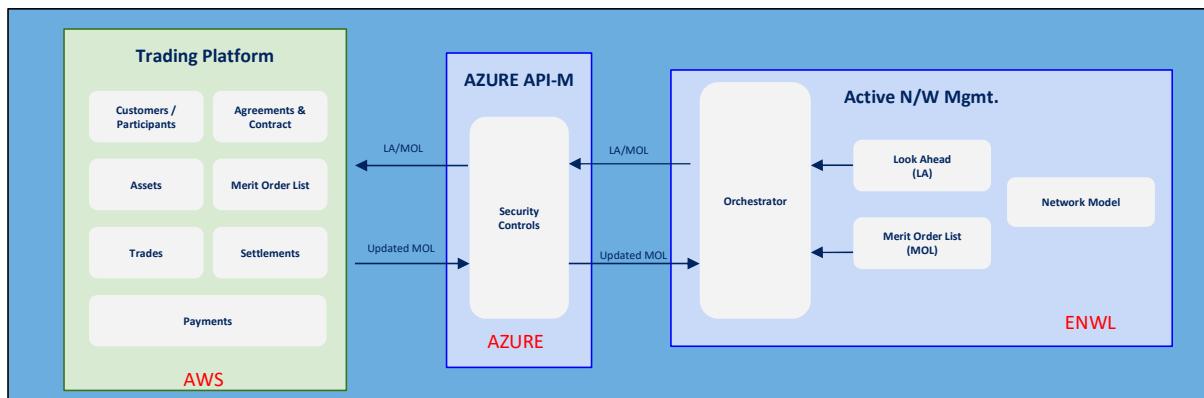

3.1 Simulation trials solution

It was decided to focus the solution build for the simulation trials on the following aspects of the future trading platform:

- End user customer experience interacting with the trading platform.
- Price discovery: so that the customers understand how the trading benefits will be realised.
- Managing the trading timelines.

This led to the conclusion that the simulation trials did not need to integrate with the live ANM system. So, the curtailment that leads to the trading activities will be simulated, along with the DER assets that are traded.

This resulted in the decision to create a simulation trials orchestrator component that managed the flow of information between ANM and the trading platform. This is shown in the solution diagram below.

The simulation trials explore a set of ten network curtailment and asset scenarios and each of these scenarios are created as a spreadsheet containing the appropriate look ahead and MOL messages.

For each of the scenarios the orchestrator submits the relevant look ahead/MOL message, and this is sent to ENWL's API Management server in AZURE called API-M. The role of API-M in the simulation trials is to provide a set of security controls to the solution. This includes authentication and access control and message payload validation.

Once the look ahead/MOL message is received by the trading platform, the information is used to set up the trading opportunity for customers to trade.

Customers will undertake their trading, specific to the scenario at that moment and the resultant updated MOL is sent back to the orchestrator via API-M. The orchestrator will then present the result of the trade and then for certain scenarios, a manual update of the curtailment index will be performed to create the MOL for the next scenario.

This is repeated over several months until all the scenarios are complete.

3.2 Simulation Trials test phases

The test approach for simulation trials has been to build and test functionality incrementally as follows:

- *Simulation trials phase 1* – Unit test of the point-to-point message interface between the orchestrator and the trading platform, via API-M. A look ahead/MOL is sent to the trading platform via API-M and the identical MOL is returned. This completed successfully.
- *Simulation trials phase 2* – Extend the scope of the testing to include a dummy trade executed on the trading platform that returns an updated MOL back to the orchestrator. This completed successfully.
- *Simulation trials phase 3* – Test the full set of end-to-end scenarios planned for the simulation trials. This completed successfully.

This test plan covers the Phase 3 testing of the simulation trials.

4. Simulation Trials Testing Overview

The ENWL IT team are responsible for three key streams of work: project delivery, small change and production support.

4.1 Testing Objectives

The objectives of testing can be summarised as:

- To confirm that the orchestrator creates the expected look ahead and MOL message payloads for each scenario and that the message is successfully submitted to the trading platform via API-M.
- To confirm that the trading platform returns the expected updated MOL via API-M in response to the look ahead and initial MOL.
- To ensure that the orchestrator reports the correct completion status of each of the simulation trials scenarios.

4.2 Testing Inputs

The inputs to the testing are spreadsheets that contain the look ahead and MOL for each of the ten scenarios. The scenarios are grouped into five groups. Each group contains scenarios that are linked sequentially or have some characteristics that are similar.

4.3 Simulation Trials Phase 3 Integration Testing

4.3.1 Overview

The simulation trials phase 3 testing will consist of the testing of ten different scenarios. These ten scenarios have been developed as the scenarios that will be run during the simulation trials phase of the BiTraDER project starting in October 24.

Each scenario will consist of 2 messages as follows:

1. *ANM orchestrator to trading platform* – Look ahead message plus MOL
2. *Trading platform to ANM orchestrator* – Updated MOL post trade execution

The ten scenarios will be grouped into five groups as follows:

Group 1 – scenarios 1,3 (scenario 2 not required due to changes to scope)

Group 2 – scenarios 4,5,6,7

Group 3 – scenarios 8,9

Group 4 – not required due to changes to scope

Group 5 – scenario 11, 12

The scenarios in group 2 will be linked in a way that the outcome from the first scenario (updated MOL and curtailment index) will be input into the next scenario and so on until the last scenario in the group is complete.

5. Simulation Trials Scenarios

5.1 Group 1 Scenario 1

The following input data will be submitted to the trading platform for scenario 1. This scenario will be executed by opening the scenarios list and opening scenario 1 button on the orchestrator Graphical User Interface (GUI).

Then perform the following:

1. Click the *Post MOL to BiTraDER* button
2. Perform the trade on the BitraDER platform
3. Click the *Get MOL from BiTraDER* button

Message 1 – Scenario 1 look ahead

Group 1 Constraint 1 - Occurs as expected		Location - Keswick Primary HV Feeder

04/10/2024 14:00	G1_Agg5	10	FlexibleOutputChange	0	kW	200	0	Aggregate_5	Seller	Agg5_Seller	Flag Set	Flag Not Set

Expected results:

4. An updated MOL (Message 2) is returned from the trading platform
5. The orchestrator MOL is updated with the changed values in the returned MOL, for the constraint between 09:00 and 09:30.
6. The status of Scenario 1 on the orchestrator admin screen is changed from “Started” to “Completed”.

5.2 Group 1 Scenario 3

The following input data will be submitted to the trading platform for scenario 3. This scenario will be executed by opening the scenarios list and opening scenario 3 button on the orchestrator (GUI).

Then perform the following:

1. Click the **Post MOL to BiTraDER** button
2. Perform the trade on the BitraDER platform
3. Click the **Get MOL from BiTraDER** button

Expected results:

- An updated MOL (Message 2) is returned from the trading platform
- The orchestrator MOL is updated with the changed values in the returned MOL, for the constraint between 09:00 and 09:30.
- The status of scenario 3 on the orchestrator admin screen is changed from “Started” to “Completed”

5.3 Group 2 Scenario 4

The following input data will be submitted to the trading platform for scenario 4. This scenario will be executed by opening the scenarios list and opening scenario 4 button on the orchestrator GUI.

Then perform the following:

- Click the **Post MOL to BiTraDER** button

2. Perform the trade on the BitraDER platform
3. Click the **Get MOL from BiTraDER** button

Message 1 – Scenario 4 look ahead

Expected results:

4. An updated MOL (Message 2) is returned from the trading platform
5. The orchestrator MOL is updated with the changed values in the returned MOL, for the constraint between 09:00 and 09:30.
6. The status of Scenario 4 on the orchestrator admin screen is changed from “Started” to “Completed”

5.4 Group 2 Scenario 5

The following input data will be submitted to the trading platform for scenario 5. Scenario 5 will be executed by opening the scenarios list and opening scenario 5 button on the orchestrator GUI. In scenario 5 check the MOL is the changed MOL from scenario 4.

This scenario will take the scenario 5 look ahead and submit to the trading platform together with the updated MOL from scenario 4.

Then perform the following:

1. Click the **Post MOL to BiTraDER** button
2. Perform the trade on the BitraDER platform
3. Click the **Get MOL from BiTraDER** button

Test Capability – Test Strategy (Testing, V0.2, November 2024)

Message 1 – Scenario 5 look ahead

Expected results:

4. An updated MOL (Message 2) is returned from the trading platform
5. The orchestrator MOL is updated with the changed values in the returned MOL, for the constraint between 07:00 and 07:30.
6. The status of Scenario 8 on the orchestrator admin screen is changed from “Started” to “Completed”

5.8 Group 3 scenario 9

The following input data will be submitted to the trading platform for scenario 9. Scenario 9 will be executed by opening the scenarios list and opening scenario 9 button on the orchestrator GUI. In scenario 9 check the MOL is the changed MOL from scenario 8.

This scenario will take the scenario 9 look ahead and submit to the trading platform together with the updated MOL from scenario 8.

Then perform the following:

1. Click the **Post MOL to BiTraDER** button
2. Perform the trade on the BitraDER platform
3. Click the **Get MOL from BiTraDER** button

Message 1 – Scenario 9 look ahead

14/04/2025 14:00	G3_Agg20	10	FlexibleOutputChange	0	kW	0	4000	Aggregate_20	Agg20_Seller

Expected results:

4. An updated MOL (Message 2) is returned from the trading platform
5. The orchestrator MOL is updated with the changed values in the returned MOL, for the constraint between 07:00 and 07:30.
6. The status of Scenario 12 on the orchestrator admin screen is changed from “Started” to “Completed”

6. Security Testing

Security testing involves testing the systems to uncover security vulnerabilities. This will require testing a variety of attack vectors. It should include:

- Validation of the login fields.
- Password strength criteria.
- Password lockout criteria.

This is performed to discover whether the login system can be forced into permitting unauthorised access. It will also ensure that the authorisation model provided for each system can be set up and will function as required.

Additional aspects of Security Testing that may be applied include:

- A Code Review for security vulnerabilities.
- Penetration Testing.
- Ethical Hacking.
- Non-Prod environments prior to decommissioning superseded Prod infrastructure.

7. Overview of Entry & Exit Criteria

Prior to commencing a test phase, pre-defined entry criteria must be met. Exit criteria must also be met prior to handover of a system/application to the subsequent test phase.

7.1 Entry Criteria

An entry criterion is a set of decision making guidelines that are used to determine whether a system under test is ready to enter a phase of testing. Each testing phase will have its own defined entry criteria. As the system progresses through the phases of testing, the entry criterion tends to become more rigorous.

7.2 When an Entry Criterion is not met

When a defined entry criterion is not met for a testing phase the testing activity cannot commence and the acceptance of a system into the testing phase will be rejected. In this case an issue should be raised to the test manager and the IT project lead.

There may be instances where an entry criterion needs to deviate from what has been defined in the test strategy or test plan. In this case, the change should be approved by the test manager and the IT project lead. Any variation should be noted in the test phase exit report.

7.3 Exit Criteria

The exit criteria are a set of decision-making guidelines that are used to determine whether a system under test is ready to exit a phase of testing. Each testing phase will have its own defined exit criteria. When the exit criteria have been satisfied, the system under test is either considered to be ready to move onto the next testing phase or it is ready for release into production.

Once considered ready to move into the next testing phase, a test phase exit report is completed. Any deviations from the planned testing or the entry/exit criteria should be captured in this document.

7.4 When an Exit Criterion is not met

When a defined exit criterion is not met for a testing phase the testing activity cannot be completed and can therefore not proceed into the subsequent testing phase. In this case an issue should be raised to the test manager and the IT project lead.

There may be instances where the exit criterion needs to deviate from what has been defined in the test strategy or test plan. In this case, the change should be approved by the test manager and the IT project lead. Any variation should be noted in the test phase exit report.

8. Simulation Trials Testing – Test Results

8.1 Introduction

This section provides a summary of the test results that were completed by the end of October 2024, prior to the commencement of the simulation trials in October 2024.

8.2 Group 1 Scenario 1

The following screenshot is the MOL list sent to the BiTraDER platform for scenario 1:

BiTrader Orchestrator													
Scenario 1: Group 1 Constraint 1
